

An introduction to ageing societies

A general overview and the Sri Lankan perspective

Lesson objectives

- At the end of this lecture, a student should be able to:
 - Understand the concept of the ageing society
 - Describe the process that leads to the ageing society and its causes
 - Understand and be able to describe the socioeconomic consequences of the ageing society
 - Understand the impact of the ageing society on families
 - Briefly describe the concept of healthy ageing

First, some questions;

- What is the concept of the „ageing society“?
- Why is the ageing of the society important and what are its effects?
- What is the cause in your opinion?

In 2018 the number of people older than 64 years old surpassed the number of children under 5 years old.

The ageing society

Population ageing is defined as the disproportional growth of the older population in a society, with regard to the overall population.

- ❓ You can see this observed (and projected) trend from the 1950's to the 2100's in the graphic.
- ❓ The median age is displayed, showing the midpoint of the population age per country.

The ageing society - causes

Median age vs. births per woman, 2020

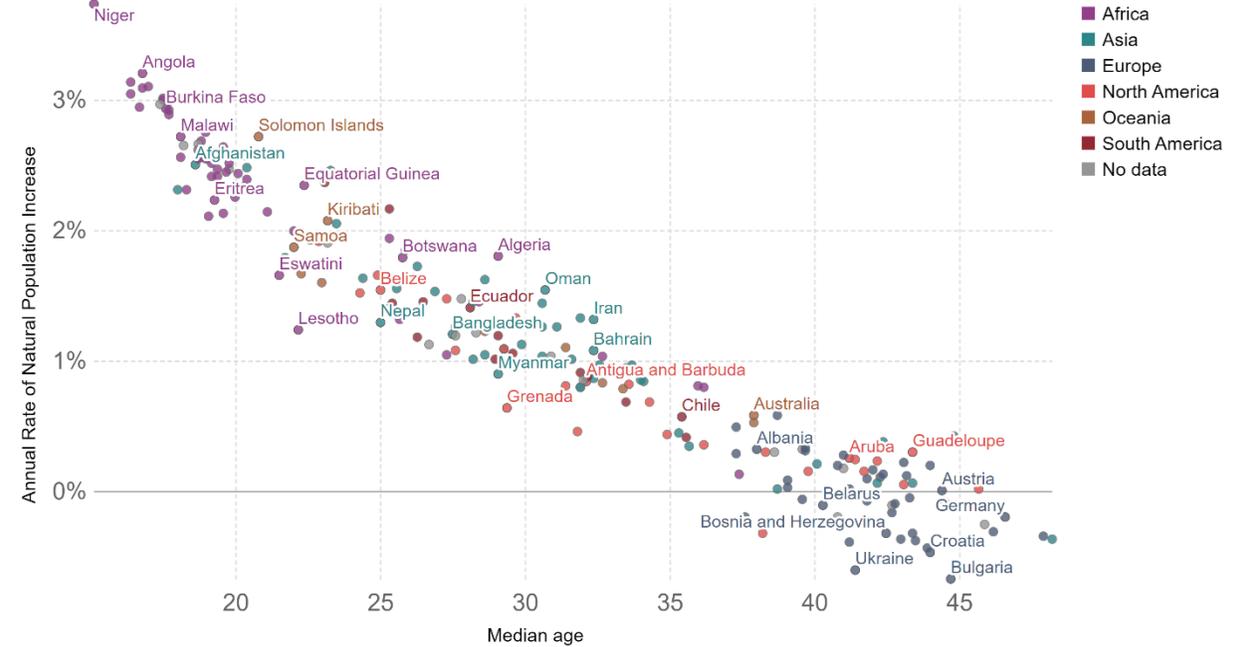

The median age divides the population in two parts of equal size: that is, there are as many persons with ages above the median as there are with ages below the median.

Source: UN Population Division (2019); World Bank
 Note: The total fertility rate is the number of children that would be born to a woman if she were to live to the end of her child-bearing years and give birth to children at the current age-specific fertility rates.

Population growth rate vs. median age, 2020

Median age is the age that divides the population in two parts of equal size, that is, there are as many persons with ages above the median as there are with ages below the median. In this metric of population growth changes due to migration are excluded and only births and deaths are taken into account.

The ageing society, stages; STAGE 1

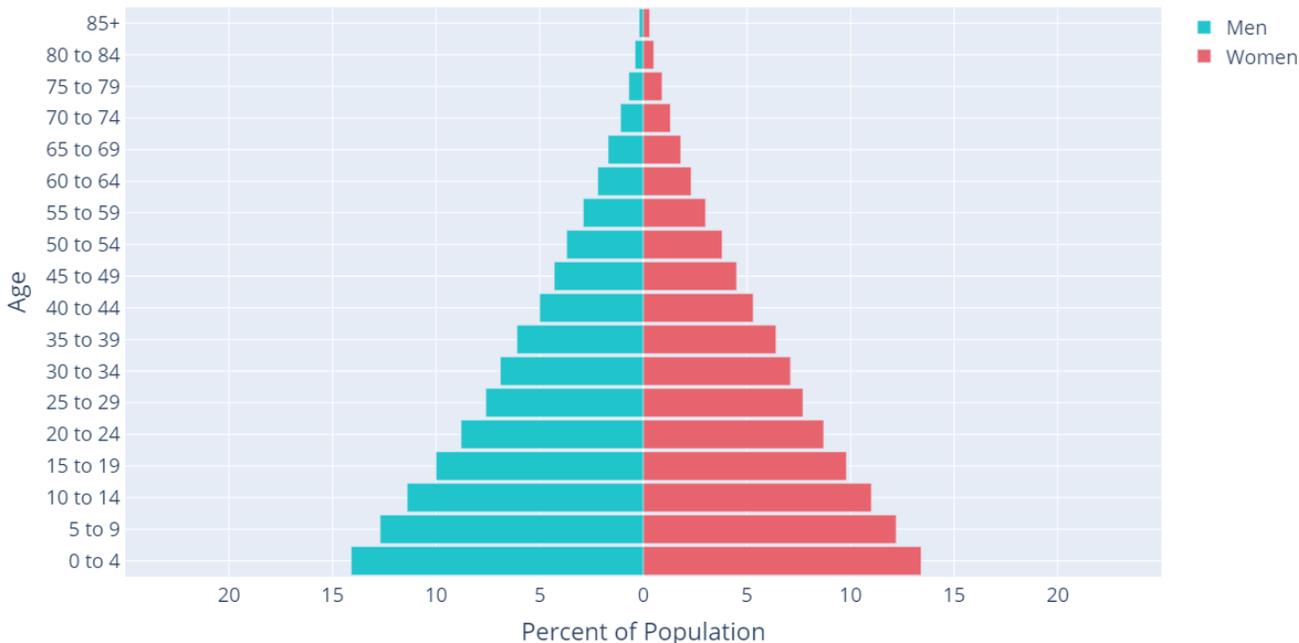

- Population growth is in the **high stationary stage**
- Birth rate is high
- Death rate is high
- This means that Niger has a young population, reflecting many births, but those born have a low chance of reaching old age.
- In this stage, the population is either slowly increasing or stagnating.
- The percentage of people aged 65+ is 2.7%

The ageing society, stages; STAGE 2

Stage 2: Population Pyramid, Ghana, 2020

- Population growth is in the **early expanding stage**
- Birth rate is high
- Death rate is starting to decline
- This means that Ghana has a young population, reflecting many births, but those born have a moderate chance of reaching old age.
- In this stage, the population is rapidly increasing.
- The percentage of people aged 65+ is 4.4%

The ageing society, stages; STAGE 3

Stage 3: Population Pyramid, India, 2020

- Population growth is in the **late expanding stage**
- Birth rate is starting to decline
- Death rate is reduced significantly
- This means that India has a young-medium aged population, reflecting a moderate amount of births, but those born have a fair chance of reaching old age.
- In this stage, the population is still rising considerably.
- The percentage of people aged 65+ is **6.7%**

The ageing society, stages; STAGE 4

Stage 4: Population Pyramid, Canada, 2020

- Population growth is in the **low stationary stage**
- Birth rate is low
- Death rate is low
- This means that Canada has an age-wise equally distributed population, reflecting relatively few births, but those born have a high chance of reaching old age.
- In this stage, the population is either slowly increasing or stagnating.
- The percentage of people aged 65+ is 19%

The ageing society, stages; STAGE 5

Stage 5: Population Pyramid, Japan, 2020

Stage 1: Population Pyramid, Niger, 2020

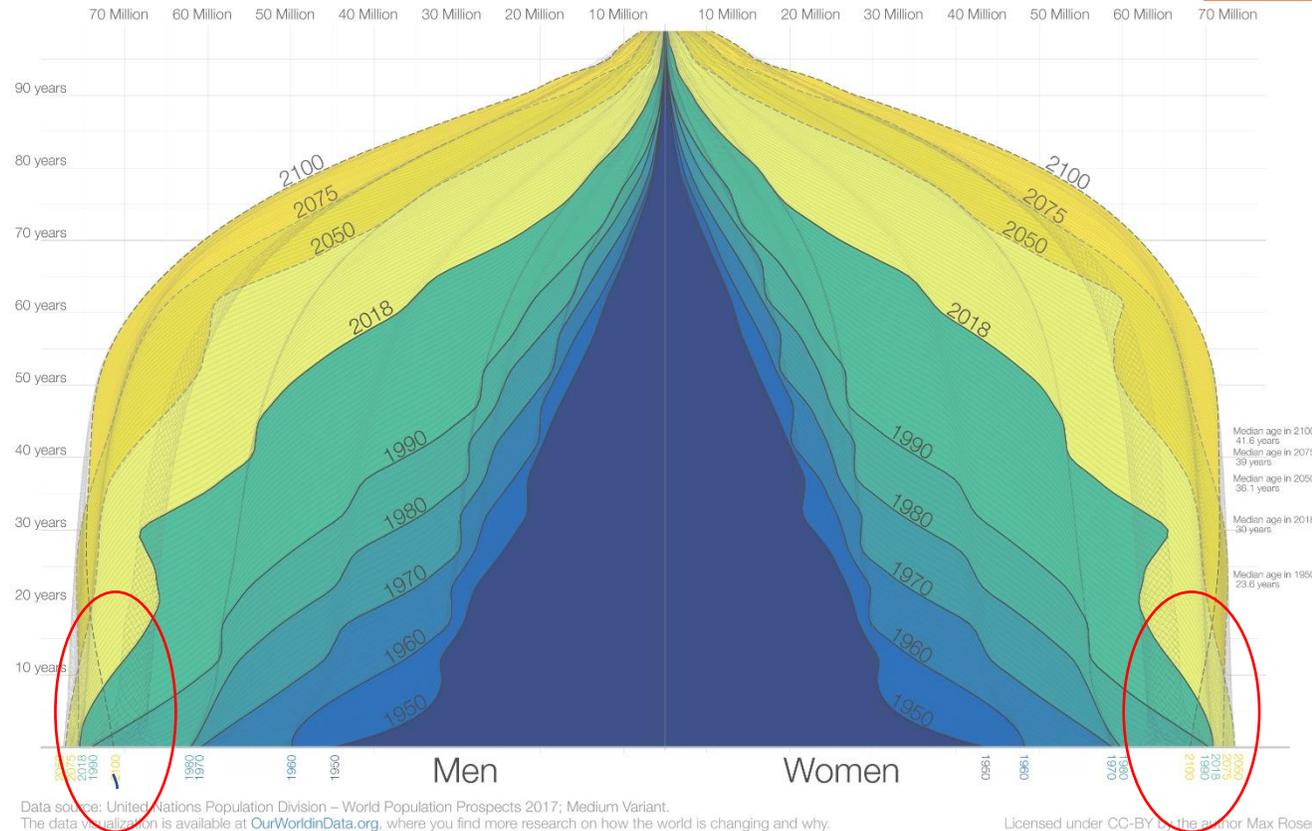

Note that in comparison to Niger, the shape of the population pyramid is becoming inverted in Japan (narrower at the base and wider towards the top).

The ageing society - consequences

The Demography of the World Population from 1950 to 2100

Shown is the age distribution of the world population – by sex – from 1950 to 2018 and the UN Population Division's projection until 2100.

Our World
in Data

- Note that in the world population demography for 2100, a narrower base of the population pyramid, compared to the top, is expected.
- What do you think, can this have any consequence for the economy, society, living conditions of people?

The ageing society - consequences

- To understand what consequences the ageing of a society can have, we first have to understand a few concepts;
 - The 3-group split of people in demography
 - children and young adolescents (under 15 years old)
 - the working-age population (15-64 years) and
 - the elderly population (65 years and older)
 - Dependency
- <https://ourworldindata.org/grapher/age-dependency-ratio-of-working-age-population>
- <https://www.tandfonline.com/doi/full/10.1080/00036846.2016.1167823>

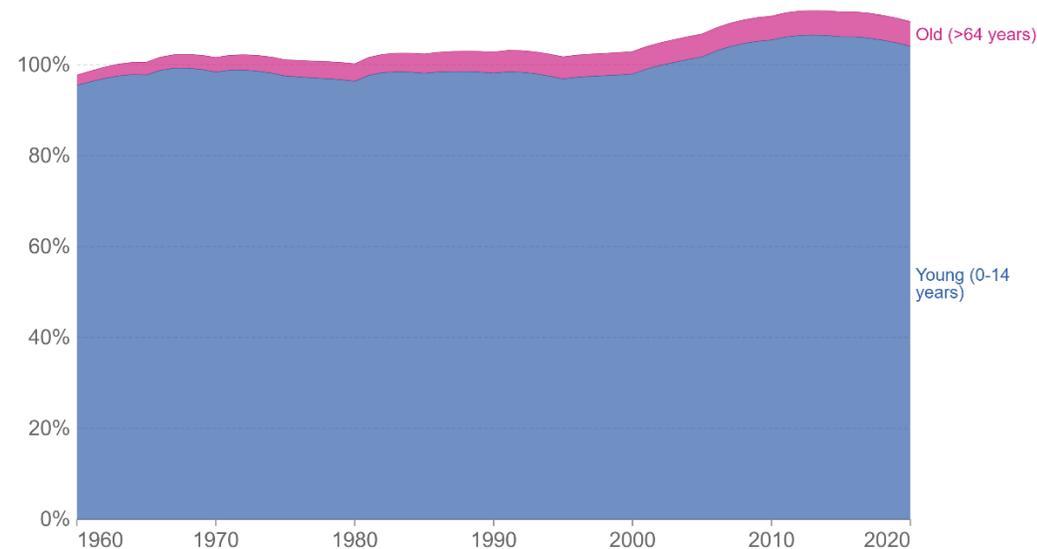

The ageing society – consequences; Dependency

Let's take the first and the last country we examined when discussing population pyramids as an example. On the right, the data for Niger is presented and on the left, the data for Japan.

Age dependency breakdown by young and old dependents, Niger, 1960 to 2020

Age dependency ratio is the ratio of dependents (either children aged 0-14 years, or older populations aged over 64 years) to the working age population (15-64 years). Data shows the relative composition of the dependent population between young and old.

The ageing society – consequences; Dependency

- Not everything is bleak, however. An important thing to keep in mind is also that not only the age of the population is rising, due to lower mortality, but also the ability of people to be effective, productive and involved (in labour and society) later in life.
- https://demographic-challenge.com/files/downloads/9ed31aa1067a5d6a50c644c46812c0fa/dc_remeasuring_aging_sanderson_scherbov_science_2010.pdf
- The full picture of dependency is thus somewhat uncertain.

IP

Youth dependency ratio, 1960 to 2020
The ratio of younger dependents – people younger than 15 – to the working-age population – those ages 15-64. Data are shown as the number of dependents per 100 working-age people.

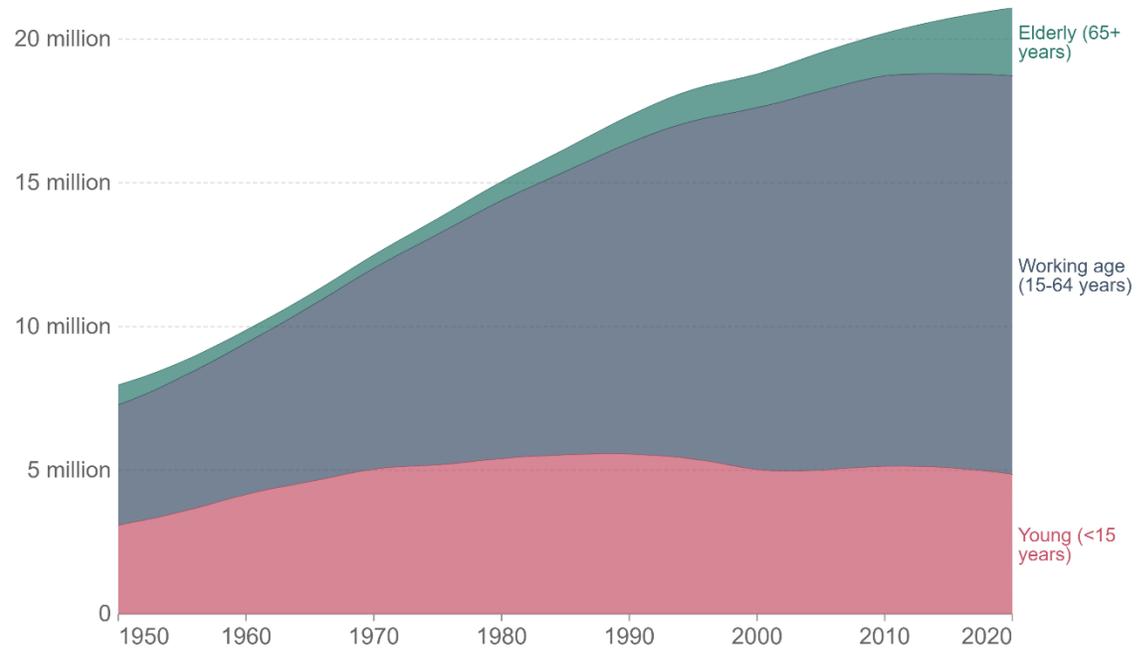

Our World in Data

Size of young, working-age and elderly populations, Sri Lanka, 1950 to 2020

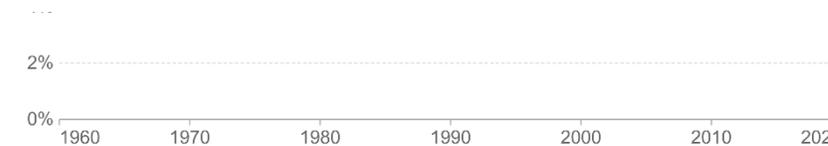

Our World in Data

Historic estimates from 1950 to 2015, and projected to 2100 based on the UN medium scenario.

The ageing society - HOMEWORK

- Use the data and tools in the below links to;
 1. Construct the population pyramid for Sri Lanka for the years 2022, 2050 and 2100
 - Comment on the population structure in each year and classify them according to the five stage model.
 - Discuss the possible causes for the changes observed and support them with projections of data
 2. Construct the dependency graphs for Sri Lanka for the years 2022, 2050 and 2100
 - Comment on the dependencies in each year and discuss how this can affect the economy, society and living conditions.
 - Present some ideas on how to best mitigate the negative effects of population ageing
